

Stacy Nicholson – Regulatory Analyst

Stacy Nicholson is a 30-year-old regulatory analyst working for a major oil company based in Houston, TX. She has a Bachelor's degree in Petroleum Engineering and has been with the company for five years. She has worked as a regulatory analyst on several projects located in Colorado and the Wyoming. Her main task is to file reports about the drilling process for each well that are sent to the state and federal government for review.

Stacy is very attentive to details, accurate, and thorough at work. She wants to ensure that every detail in the completions reports and sundries that she files with the state and federal government is correct. Sometimes she gets frustrated because the data from the field is not correctly recorded in OpenWells. She feels that she would accomplish much more at work if the workers out in the field would provide her with more accurate and timely information.

Stacy is enthusiastic about learning new software applications and using them in her work, and will generally work around any minor usability errors or difficulties she finds in the software. However, if a software package is too difficult to use, or takes too long to learn, she'll try and find an easier way to accomplish her goals – which often results in keeping information and records in local files instead of accessing them from a central server.

Stacy's Goals

Deliver reports quickly and accurately. Stacy is highly motivated to improve her work efficiency, deliver high quality reports, and be a productive contributor to her team and company. She works hard to make sure that reports are filed by their deadlines, and that they contain accurate information.
